Abstract: Topological entropy can be an indicator of complicated behavior in dynamical systems. It is first introduce by Adler, Konheim and McAndrew by using open covers in 1965. After that it is still an active research by many researchers to produce more properties and applications up to nowadays. The purpose of this paper is to review and explain most important concepts and results of topological entropies of continuous self-maps for dynamical systems on compact and non-compact topological and metric spaces. We give proofs for some of its elementary properties of the topological entropy. Slight modification on Adler’s topological entropy is also presented.

Keywords: Dynamical system, topological entropy, continuous maps, compact space, metric space.

1. Introduction

Let $X$ be a Hausdorff topological space and $f:X \to X$ be a continuous self-map on $X$. The pair $(X,f)$ is called a dynamical system. If $n \in \mathbb{N}$, then $f^n = f \circ f^{n-1}$, $f^1 = f$ and $f^0$ is the identity map on $X$. For $x \in X$, the sequence $\{f^n(x) : n \in \mathbb{N}\}$ is called the orbit of $x$. If $f$ is a homeomorphism, the full orbit of $x$ is the sequence $\{f^n(x) : n \in \mathbb{Z}\}$.

Topological entropy can be an indicator of complicated (chaotic) behavior in dynamical systems. Whether the topological entropy of a dynamical system is positive or not is of primary significance, due to the fact that positive topological entropy implies that one can assert that the system is chaotic. It is hard, as remarked by [9], to get a good idea of what topological entropy means directly from various definitions of topological entropy. Thus it is enough to know that topological entropy of a dynamical system is a measure of complexity of dynamic behavior of the system, and it can be seen as a quantitative measurement of how chaotic of a dynamical system.

Generally speaking, the larger the topological entropy of a system is the more complicated the dynamics of this system would be.

This paper is organized as follow. In section 2, we review the earlier concept of topological entropy introduced by Adler et al. [1] as an invariant of topological conjugacy and also as an analogue of measure theoretic entropy. This topological entropy only holds on a compact topological space. In section 3, we review and discuss another definition of topological entropy introduced by Bowen [2] using separating and spanning sets on metric space. This definition holds not only on compact space but also on non-compact space. Finally in the last section, slight modification of Adler’s topological entropy has been done by changing the symbol of refinement.

2. Topological Entropy for Maps on Compact Spaces

The original definition of topological entropy begins in 1965 by Adler et al. [1]. They introduce the topological entropy of a continuous self-map $f:X \to X$ on a compact space $X$. So in this section, we always let $X$ be a nonempty compact topological space, and $f:X \to X$ a continuous self-map.

Definition 2.1. For any open cover $\mathcal{U}$ of $X$, let $N(\mathcal{U})$ denote the number of sets in a subcover of minimal cardinality. A subcover of a cover is minimal
if no other subcover contains fewer members. We call $H(\mathcal{U}) = \log N(\mathcal{U})$ the entropy of $\mathcal{U}$.

Since $X$ is compact and $\mathcal{U}$ is an open cover, there always exists a finite subcover. Then we have $H(\mathcal{U}) = \log \min(\text{card} (\mathcal{V}) : \mathcal{V}$ a finite subcover of $\mathcal{U}$).

**Definition 2.2.** For any two covers $\mathcal{U}, \mathcal{V}$ of $X$, $\mathcal{U} \lor \mathcal{V} \equiv \{A \cap B : A \in \mathcal{U}, B \in \mathcal{V}\}$ defines their join. Similarly we can define the join $\bigvee_{k=1}^n \mathcal{U}_k = \{\bigcap_{k=1}^n A_k : A_k \in \mathcal{U}_k\}$ of any finite collection of open covers of $X$.

Let $f : X \to X$ be a continuous mapping on a compact space $X$. If $\mathcal{U}$ is an open cover of $X$, then from continuity, the family $f^{-1}(\mathcal{U}) = \{f^{-1}(U) : U \in \mathcal{U}\}$ is again an open cover of $X$. Sometimes we will write $f^{-1}\mathcal{U}$ instead of $f^{-1}(\mathcal{U})$ if there is no chance for confusion. Similarly for $f'\mathcal{U}$.

The following proposition state the properties of $N(\mathcal{U})$ and $H(\mathcal{U})$.

**Proposition 2.1.** Let $\mathcal{U}, \mathcal{V}$ be two open covers of a compact space $X$. Then

(i) $N(\mathcal{U} \lor \mathcal{V}) \leq N(\mathcal{U}) \cdot N(\mathcal{V})$ and $H(\mathcal{U} \lor \mathcal{V}) \leq H(\mathcal{U}) + H(\mathcal{V})$;

(ii) $f^{-1}(\mathcal{U} \lor \mathcal{V}) = f^{-1}(\mathcal{U}) \lor f^{-1}(\mathcal{V})$;

(iii) $N(f^{-1}(\mathcal{U})) \geq N(f^{-1}(\mathcal{V}))$ and $H(f^{-1}(\mathcal{U})) \geq H(f^{-1}(\mathcal{V}))$. If $f$ is onto, we have equality.

(iv) $N(f'\mathcal{U}) \geq N(\mathcal{U})$ and $H(f'\mathcal{U}) \geq H(\mathcal{U})$. If $f$ is homeomorphism, we have equality.

**Proof.** (i) Let $\{A_1, ..., A_{N(\mathcal{U})}\}$ and $\{B_1, ..., B_{N(\mathcal{V})}\}$ be subcovers of $\mathcal{U}$ and $\mathcal{V}$ of minimal cardinality, respectively. Then

$\{A_i \cap B_j : i = 1, ..., N(\mathcal{U}), j = 1, ..., N(\mathcal{V})\}$

is a subcover of $\mathcal{U} \lor \mathcal{V}$ (possibly not minimal) of cardinality $N(\mathcal{U}) \cdot N(\mathcal{V})$. Consequently $N(\mathcal{U} \lor \mathcal{V}) \leq N(\mathcal{U}) \cdot N(\mathcal{V})$.

(ii) By the property of inverse image,

$f^{-1}(\mathcal{U} \lor \mathcal{V}) = \{f^{-1}(A \cap B) : A \in \mathcal{U}, B \in \mathcal{V}\}$

$= \{f^{-1}(A) \cap f^{-1}(B) : A \in \mathcal{U}, B \in \mathcal{V}\}$

$= f^{-1}(\mathcal{U}) \lor f^{-1}(\mathcal{V})$.

(iii) Let $\{A_1, ..., A_{N(\mathcal{U})}\}$ be a subcover of $\mathcal{U}$ of minimal cardinality. Since $\{f^{-1}(A_1), ..., f^{-1}(A_{N(\mathcal{U})})\}$ is also a subcover of $f^{-1}\mathcal{U}$, possibly not minimal, we have $N(f^{-1}\mathcal{U}) \leq N(\mathcal{U})$. If $f$ is onto and $\{f^{-1}(A_1), ..., f^{-1}(A_{N(f^{-1}\mathcal{U})})\}$ is a subcover of $f^{-1}\mathcal{U}$ of minimal cardinality, then also $\{A_1, ..., A_{N(f^{-1}\mathcal{U})}\}$ is a subcover of $\mathcal{U}$. Thus we have, $N(f^{-1}\mathcal{U}) \geq N(\mathcal{U})$.

(iv) Let $\{fA_1, ..., fA_{N(f'\mathcal{U})}\}$ be a subcover of $f'\mathcal{U}$ of minimal cardinality. Since $\{f^{-1}(fA_1), ..., f^{-1}(fA_{N(f'\mathcal{U})})\}$ is also a subcover of $f^{-1}f'\mathcal{U}$, possibly not minimal, we have $N(f^{-1}f'\mathcal{U}) \leq N(f'\mathcal{U})$. Since $\mathcal{U} \subseteq f^{-1}f'\mathcal{U}$, $N(\mathcal{U}) \leq N(f^{-1}f'\mathcal{U})$ and therefore $N(\mathcal{U}) \leq N(f'\mathcal{U})$. If $f$ is homeomorphism and $\{f^{-1}(fA_1), ..., f^{-1}(fA_{N(f'\mathcal{U})})\}$ is a subcover of $f^{-1}f'\mathcal{U}$ of minimal cardinality, then also $\{fA_1, ..., fA_{N(f^{-1}f'\mathcal{U})}\}$ is a subcover of $f'\mathcal{U}$.

**Remark.** (i) The operation $\lor$ is obviously commutative and associative.

(ii) $f^{-1}(\bigvee_{k=0}^{n-1} \mathcal{U}_k) = \bigvee_{k=0}^{n-1} f^{-1}(\mathcal{U}_k)$.

**Lemma 2.1.** For every open cover $\mathcal{U}$ of $X$, the following

$$\lim_{n \to \infty} \frac{1}{n} H(\bigvee_{k=0}^{n-1} f^{-k}(\mathcal{U}))$$

exists and is a nonnegative real number.

**Proof.** Consider the sequence $c_n = H(\bigvee_{k=0}^{n-1} f^{-k}(\mathcal{U}))$, $n \in \mathbb{N}$. Since $X$ is nonempty, every open cover of $X$ contains at least one set, and therefore $c_n \geq 0$ for all $n \in \mathbb{N}$. Proposition 2.1 implies that $(c_n : n \in \mathbb{N})$ is subadditive, i.e., $c_{m+n} \leq c_m + c_n$ for all $m, n \in \mathbb{N}$:

$c_{m+n} = H(\bigvee_{k=0}^{m+n-1} f^{-k}(\mathcal{U}))$

$= H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-m-n+1}\mathcal{U})$

$= H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-m-1}\mathcal{U} \lor f^{-m} \mathcal{U} \lor \cdots \lor f^{-m-n+1}\mathcal{U})$

$= H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-m-1}\mathcal{U} \lor f^{-m} \mathcal{U} \lor \cdots \lor f^{-m-n+1}\mathcal{U})$

$\leq H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-m-1}\mathcal{U} \lor f^{-m} \mathcal{U} \lor \cdots \lor f^{-m-n+1}\mathcal{U})$

$\leq H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-m-1}\mathcal{U} \lor f^{-m} \mathcal{U} \lor \cdots \lor f^{-m-n+1}\mathcal{U})$

$+ H(f^{-m}(\mathcal{U} \lor \cdots \lor f^{-n+1}\mathcal{U}))$
\[ \leq H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-n+1}\mathcal{U}) \\
+ H(\mathcal{U} \lor \cdots \lor f^{-n+1}\mathcal{U}) \]
\[ = c_m + c_n. \]

The fourth equality follows from Proposition 2.1(ii); the next inequality from Proposition 2.1 (i); and the final inequality from Proposition 2.1 (iii). From the subadditityof \((c_n)\), clearly it is a decreasing sequence. It follows by an elementary result from real analysis that the \(\lim_{n \to \infty} c_n\) exists and equals \(\inf_{n \in \mathbb{N}} c_n\). Thus the \(\lim_{n \to \infty} \frac{c_n}{n}\) exists and is a nonnegative real number. ■

**Definition 2.3.** The topological entropy of \(f\) with respect to an open cover \(\mathcal{U}\) is defined by

\[ h(f, \mathcal{U}) = \lim_{n \to \infty} \frac{1}{n} H(\mathcal{V}^n_{k=0} f^{-k}(\mathcal{U})), \]

and the topological entropy of \(f\) is defined as \(h(f) = \sup_{\mathcal{U}} h(f, \mathcal{U})\); \(\mathcal{U}\) is an open cover of \(X\), where the supremum is taken over all open covers \(\mathcal{U}\) of \(X\). Obviously, \(h(f) \in [0, \infty]\).

**Lemma 2.2.** Let \(\mathcal{U}\) be an open cover of \(X\). Then \(h(f, \mathcal{U}) \leq H(\mathcal{U})\).

**Proof.** By Definition 2.3, Proposition 2.1 (i) and (iii),

\[ h(f, \mathcal{U}) = \lim_{n \to \infty} \frac{1}{n} H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-n+1}\mathcal{U}) \]
\[ \leq \lim_{n \to \infty} \frac{1}{n} [H(\mathcal{U}) + H(f^{-1}\mathcal{U}) + \cdots + H(f^{-n+1}\mathcal{U})] \]
\[ \leq \lim_{n \to \infty} \frac{1}{n} [H(\mathcal{U}) + H(\mathcal{U}) + \cdots + H(\mathcal{U})] \]
\[ = \lim_{n \to \infty} \frac{1}{n} [nH(\mathcal{U})] = H(\mathcal{U}). \] ■

**Definition 2.4.** A cover \(\mathcal{V}\) is said to be a refinement of a cover \(\mathcal{U}\), denoted \(\mathcal{U} \prec \mathcal{V}\), if every element of \(\mathcal{V}\) is a subset of some element of \(\mathcal{U}\). In other words, \(\mathcal{U} \prec \mathcal{V}\) if \(A \in \mathcal{U}\), there exists a \(B \in \mathcal{U}\) such that \(A \subseteq B\).

**Lemma 2.3.** Let \(\mathcal{U}, \mathcal{V}, \mathcal{U}'\) and \(\mathcal{V}'\) be open covers of \(X\). Then the following statements hold:

(i) \(\mathcal{U} \prec \mathcal{U}', \mathcal{V} \prec \mathcal{V}' \Rightarrow \mathcal{U} \lor \mathcal{V} \prec \mathcal{U}' \lor \mathcal{V}'\).

(ii) \(\mathcal{U} \prec \mathcal{V} \Rightarrow N(\mathcal{U}) \leq N(\mathcal{V})\) and \(H(\mathcal{U}) \leq H(\mathcal{V})\).

(iii) \(\mathcal{U} \lor \mathcal{V} \Rightarrow N(\mathcal{U} \lor \mathcal{V}) = N(\mathcal{V})\) and

\[ H(\mathcal{U} \lor \mathcal{V}) = H(\mathcal{V}). \]

(iv) \(\mathcal{U} \lor \mathcal{V} \Rightarrow f^{-1}(\mathcal{U}) < f^{-1}(\mathcal{V})\)

(v) \(\mathcal{U} \lor \mathcal{V} \Rightarrow h(f, \mathcal{U}) \leq h(f, \mathcal{V})\).

**Proof.** (i) Consider \(A' \cap B \in \mathcal{U} \lor \mathcal{V}'\) where \(A' \subseteq \mathcal{U}\) and \(B' \subseteq \mathcal{V}'\). By hypothesis there exists \(A \in \mathcal{U}\) and \(B \in \mathcal{V}\) such that \(A' \subseteq A\) and \(B' \subseteq B\). Thus \(A' \cap B' \subseteq A \cap B\) where \(A \cap B \in \mathcal{U} \lor \mathcal{V}\).

(ii) Let \(\{B_1, ..., B_N(\mathcal{V})\}\) be a subcover of \(\mathcal{V}\) of minimal cardinality. Since \(\mathcal{U} \subset \mathcal{V}\), there exists a subcover \(\{A_1, ..., A_N(\mathcal{U})\}\) of \(\mathcal{U}\) such that \(A_i \subseteq B_i\) for \(i = 1, ..., N(\mathcal{V})\). Therefore \(N(\mathcal{U}) \leq N(\mathcal{V})\).

(iii) Obviously by (i), \(\mathcal{V} = \{X\} \lor \mathcal{U} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V}\) so that \(N(\mathcal{V}) \leq N(\mathcal{U} \lor \mathcal{V})\) by (ii). On the other hand, \(\mathcal{U} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V}\) implies \(\mathcal{U} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V} \lor \mathcal{V}\). Thus \(N(\mathcal{U} \lor \mathcal{V}) \leq N(\mathcal{V})\).

(iv) Let \(A \in f^{-1}(\mathcal{V})\), then \(f(A) \in \mathcal{V}\). Since \(\mathcal{U} \lor \mathcal{V}\), there exists \(B \in \mathcal{U}\) such that \(f(A) \subseteq B\). This implies that \(A \subseteq f^{-1}(f(A)) \subseteq f^{-1}(B) \subseteq f^{-1}(\mathcal{U})\). Thus \(f^{-1}(\mathcal{U}) < f^{-1}(\mathcal{V})\).

(v) By part (i) and (iv), it follows that \(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-n+1}\mathcal{U} \lor \mathcal{V} \lor f^{-1}\mathcal{V} \lor \cdots \lor f^{-n+1}\mathcal{V}\) for all \(n \in \mathbb{N}\). Therefore by (ii),

\[ H(\mathcal{U} \lor f^{-1}\mathcal{U} \lor \cdots \lor f^{-n+1}\mathcal{U}) \]
\[ \leq H(\mathcal{V} \lor f^{-1}\mathcal{V} \lor \cdots \lor f^{-n+1}\mathcal{V}). \]

This yields the claim. ■

**Theorem 2.1.** If \(\phi:X \to Y\) is a continuous surjection and \(g:Y \to Y\) a continuous map such that \(\phi \circ f = g \circ \phi\), then \(h(g) \leq h(f)\). If \(\phi\) is a homeomorphism, then \(h(f) = h(g)\).

**Proof.** If \(\mathcal{U}\) is an open cover of \(Y\), then \(\phi^{-1}(\mathcal{U})\) is an open cover of \(X\) and

\[ h(f, \phi^{-1}(\mathcal{U})) = \lim_{n \to \infty} \frac{1}{n} H(V_{k=0}^{n-1} \phi^{-k}(\phi^{-1}\mathcal{U})) \]
\[ = \lim_{n \to \infty} \frac{1}{n} H(V_{k=0}^{n-1} \phi^{-1}(g^{-k}\mathcal{U})) \]
\[ = \lim_{n \to \infty} \frac{1}{n} H(f^{-1}V_{k=0}^{n-1} g^{-k}\mathcal{U}) \]
\[ = \lim_{n \to \infty} \frac{1}{n} H(V_{k=0}^{n-1} g^{-k}(\mathcal{U})) \]
\[ = h(g, \mathcal{U}) \]
by Proposition 2.1 (iii). It follows that
\[ h(f) = \sup_{\mathcal{V}} \{ h(f, \mathcal{V}) : \mathcal{V} \text{ is an open cover of } X \} \]
\[ \geq \sup_{\phi^{-1}} \{ h(f, \phi^{-1}\mathcal{U}) : \phi^{-1}\mathcal{U} \text{ is an open cover of } X \} \]
\[ = \sup_{\mathcal{U}} \{ h(g, \mathcal{U}) : \mathcal{U} \text{ is an open cover of } Y \} \]
\[ = h(g). \]

If \( \phi \) is a homeomorphism and if \( \mathcal{U} \) is an open cover of \( X \), then \( \phi(\mathcal{U}) = (\phi^{-1})^{-1}(\mathcal{U}) \) is an open cover of \( Y \) and we have \( \phi^{-1} \circ g = f \circ \phi^{-1} \). So
\[ h(g, \phi\mathcal{U}) = h(g, (\phi^{-1})^{-1}(\mathcal{U})) \]
\[ = \lim_{n \to \infty} \frac{1}{n} \log \left( \underset{k=0}{\overset{n-1}{\bigvee}} f^{-k}(\mathcal{U}) \right) \]
\[ = \lim_{n \to \infty} \frac{1}{n} \log \left( \phi^{-1} \left( \underset{k=0}{\overset{n-1}{\bigvee}} f^{-k}(\mathcal{U}) \right) \right) \]
\[ = \lim_{n \to \infty} \frac{1}{n} \log \left( \phi^{-1} \left( \mathcal{U} \right) \right) \]
by Proposition 2.1 (iii). It follows that
\[ h(g) = \sup_{\mathcal{U}} \{ h(g, \mathcal{V}) : \mathcal{V} \text{ is an open cover of } Y \} \]
\[ \geq \sup_{\phi\mathcal{U}} \{ h(g, \phi\mathcal{U}) : \phi\mathcal{U} \text{ is an open cover of } Y \} \]
\[ = \sup_{\mathcal{U}} \{ h(f, \mathcal{U}) : \mathcal{U} \text{ is an open cover of } X \} \]
\[ = h(f). \]

\[ \textbf{Corollary 2.1.} \] Let \( f : X \to X \) be a continuous mapping and let \( \sim \) be an equivalence relation on \( X \) such that \( f(x) \sim f(y) \) whenever \( x \sim y \). Let \( \bar{f} : X/\sim \to X/\sim \) be the mapping defined by \( \bar{f} \circ \pi = \pi \circ f \) where \( \pi \) is the projection of \( X \) onto \( X/\sim \). Then \( h(\bar{f}) \leq h(f) \).

\[ \textbf{Proof.} \] The projection \( \pi : X \to X/\sim \) is a continuous surjection with \( \bar{f} \circ \pi = \pi \circ f \). The result follows by Theorem 2.1.

\[ \textbf{Theorem 2.2.} \] Topologically conjugate maps have the same topological entropy, \( h(f) = h(g \circ f \circ g^{-1}) \) where \( f : X \to X \) is a continuous map and \( g : X \to Y \) is a homeomorphism.

\[ \textbf{Proof.} \] Let \( \mathcal{U} \) be an open cover of \( X \). Since \( g \) is a homeomorphism, \( g\mathcal{U} \) is an open cover of \( Y \). Hence
\[ h(g \circ f \circ g^{-1}, g\mathcal{U}) \]
\[ = \lim_{n \to \infty} \frac{1}{n} \log \left( \mathcal{V}^{n-1}_{i=0} (g \circ f \circ g^{-1})^{-i}(\mathcal{U}) \right) \]
\[ = \lim_{n \to \infty} \frac{1}{n} \log \left( g\mathcal{V}^{n-1}_{i=0} (f \circ g^{-1})^{-i}(\mathcal{U}) \right) \]
\[ = \lim_{n \to \infty} \frac{1}{n} \log \left( \mathcal{V}^{n-1}_{i=0} (f^{-1})^{-i}(\mathcal{U}) \right) \]
by Lemma 2.3(ii). Thus \( kh(f) \geq h(f) \).

(ii) If \( f \) is a homeomorphism and \( \mathcal{U} \) any open
cover of \( X \), then
\[
  h(f, \mathcal{U}) = \lim_{n \to \infty} \frac{1}{n} H(\mathcal{V}_{K=0}^{n-1} f^{-k}(\mathcal{U}))
\]
\[
  = \lim_{n \to \infty} \frac{1}{n} H(f^{n-1}(\mathcal{V}_{K=0}^{n-1} f^{-k}(\mathcal{U})))
\]
\[
  = \lim_{n \to \infty} \frac{1}{n} H(\mathcal{U} \lor f^{i} \mathcal{U} \lor \ldots \lor f^{n} \mathcal{U})
\]
\[
  = \lim_{n \to \infty} \frac{1}{n} H(\mathcal{U} \lor (f^{-1})^{-1} \mathcal{U} \lor \ldots \lor (f^{-n+1}) \mathcal{U})
\]
\[
  = h(f^{-1}, \mathcal{U}).
\]
Thus \( h(f) = h(f^{-1}) \). If \( k < 0 \), then
\[
  h(f^{k}) = h((f^{-1})^{-k}) = -kh(f^{-1}) = |k|h(f).
\]
This yields the statement. ■

3. Topological Entropy for Maps on Metric Spaces

Bowen [2] defines the topological entropy \( h(f) \) of a uniformly continuous map \( f : X \to X \) on an arbitrary metric space \( (X, d) \) (not necessarily compact) via \((n, \epsilon)\)-separated and \((n, \epsilon)\)-spanning sets. In general, this quantity depends on the metric \( d \). But for \( X \) being compact it coincides with the topological entropy as defined by Adler et al. [1].

**Definition 3.1.** Let \((X, d)\) be a metric space and \( f : X \to X \) a uniformly continuous map (abbreviated: \( f \in \text{UC}(X, d) \)). For each \( n \in \mathbb{N} \), \( d_{n,f}(x, y) = \max_{0 \leq i \leq n-1} d(f^{i}(x), f^{i}(y)) \) defines a metric on \( X \), topologically equivalent to \( d \). A set \( E \subseteq X \) is \((n, \epsilon)\)-separated if for all \( x, y \in E \) with \( x \neq y \) it holds that \( d_{n,f}(x, y) > \epsilon \). A set \( F \subseteq X \) is \((n, \epsilon)\)-spans another set \( K \subseteq X \) (with respect to \( f \)) if for every \( x \in K \) there is a \( y \in F \) with \( d_{n,f}(x, y) \leq \epsilon \).

**Definition 3.1.** For a compact set \( K \subseteq X \), let \( r_{n}(\epsilon, K) \) be the smallest cardinality of a set which \((n, \epsilon)\)-spans \( K \), and let \( s_{n}(\epsilon, K) \) be the largest cardinality of an \((n, \epsilon)\)-separated set contained in \( K \). We write \( r_{n}(\epsilon, K, f) \) or \( s_{n}(\epsilon, K, f) \) if we wish to stress the dependence on \( f \). Define
\[
  s(\epsilon, K, f) = \limsup_{n \to \infty} \frac{1}{n} \log r_{n}(\epsilon, K),
\]
\[
  s(\epsilon, K, f) = \limsup_{n \to \infty} \frac{1}{n} \log s_{n}(\epsilon, K).
\]

**Lemma 3.1.**

(i) \( r_{n}(\epsilon, K) \leq s_{n}(\epsilon, K) \leq r_{n} \left( \frac{1}{2} \epsilon, K \right) < \infty \).

(ii) For \( \epsilon_{1} < \epsilon_{2} \), \( r(\epsilon_{1}, K, f) \geq r(\epsilon_{2}, K, f) \) and \( s(\epsilon_{1}, K, f) \geq s(\epsilon_{2}, K, f) \).

By the Lemma 3.1, the following definition makes sense.

**Definition 3.2.** For \( f \in \text{UC}(X, d) \) and \( K \subseteq X \) compact, set \( h_{d}(f, K) = \lim_{\epsilon \to 0} r(\epsilon, K, f) = \lim_{\epsilon \to 0} s(\epsilon, K, f) \), and one defines the topological entropy of \( f \) is \( h_{d}(f) = \sup(h_{d}(f, K) : K \subseteq X \) compact.

In Definition 3.2, we stress the dependence on the metric \( d \) used. Metrics \( d \) and \( d' \) on \( X \) are uniformly equivalent if \( \text{id}_{d} : (X, d) \to (X, d') \) and \( \text{id}_{d'} : (X, d') \to (X, d) \) are both uniformly continuous maps of metric spaces. In this case \( f \in \text{UC}(X, d) \) if and only if \( f \in \text{UC}(X, d') \). Bowen [2] proves the following properties of \( h_{d}(f) \).

**Theorem 3.1.** (i) If \( d_{1} \) and \( d_{2} \) are uniformly equivalent metrics on \( X \), then \( h_{d_{1}}(f) = h_{d_{2}}(f) \).

(ii) For iterares it holds that \( h_{d}(f^{m}) = m \cdot h_{d}(f) \) for all \( f \in \text{UC}(X, d) \) and \( m \in \mathbb{N} \).

**Proof.** (i) Given \( \epsilon_{1} > 0 \), choose \( \epsilon_{2} > 0 \) such that \( d_{2}(x, y) < \epsilon_{2} \) implies \( d_{1}(x, y) < \epsilon_{1} \) and choose \( \epsilon_{3} > 0 \) such that \( d_{1}(x, y) < \epsilon_{3} \) implies \( d_{2}(x, y) < \epsilon_{2} \). Let \( K \subseteq X \) be compact, then an \((n, \epsilon_{2})\)-spanning family of \( K \) with respect to \( d_{1} \) implies \((n, \epsilon_{1})\)-spanning family of \( K \) with respect to \( d_{2} \). Hence \( r_{n}(\epsilon_{1}, K, d_{1}) \leq r_{n}(\epsilon_{2}, d_{2}) \). Similarly \( r_{n}(\epsilon_{2}, K, d_{2}) \leq r_{n}(\epsilon_{1}, K, d_{1}) \). Letting \( n \to \infty \), \( r_{d_{1}}(\epsilon_{1}, K, f) \leq r_{d_{2}}(\epsilon_{2}, K, f) \leq r_{d_{1}}(\epsilon_{3}, K, f) \). If \( \epsilon_{1} \to 0 \), then \( \epsilon_{2} \to 0 \) and \( \epsilon_{3} \to 0 \) so we have \( h_{d_{1}}(f, K) = h_{d_{2}}(f, K) \).

(ii) Clearly, \( r_{n}(\epsilon, K, f^{m}) \leq r_{mn}(\epsilon, K, f) \); it follows that \( \frac{1}{n} \log r_{n}(\epsilon, K, f^{m}) \leq \frac{m}{mn} \log r_{mn}(\epsilon, K, f) \) and therefore \( h_{d}(f^{m}) \leq m \cdot h_{d}(f) \). Since \( f \in \text{UC}(X, d) \), given \( \epsilon > 0 \), there exist \( \delta > 0 \) such that \( d(x, y) < \delta \Rightarrow d(f(x), f(y)) < \epsilon \).
δ implies \( \max_{0 \leq n \leq m} d(f^i(x), f^i(y)) < \varepsilon \). So an \((n, \delta)\)-spanning set for \( K \) with respect to \( f^m \) is automatically an \((mn, \varepsilon)\)-spanning set for \( K \) with respect to \( f \). Hence \( r_n(\delta, K, f^m) \geq r_{mn}(\varepsilon, K, f) \), so \( r(\delta, K, f^m) \geq m r(\varepsilon, K, f) \). Therefore \( h_d(f^m, K) \geq m \cdot h_d(f, K) \). So, \( h_d(f^m) \geq m \cdot h_d(f) \).

If \( X \) is compact and if \( d \) and \( d' \) are equivalent metrics then they are uniformly equivalent. Also each continuous map \( f: X \to X \) is uniformly continuous. Therefore if \( X \) is compact metrizable space the entropy of \( f \) does not depend on the metric chosen on \( X \) (provided that metric induces the topology of \( X \)).

**Theorem 3.2.** Let \( (X, d) \) be a metric space and \( f \in \text{UC}(X, d) \). If \( K \subseteq K_1 \cup \cdots \cup K_m \) are all compact subsets of \( X \), then

\[
\begin{align*}
  h_d(f, K) &\leq \max_{1 \leq i \leq m} h_d(f, K_i).
\end{align*}
\]

**Proof.** Clearly \( s_n(\varepsilon, K) \leq s_n(\varepsilon, K_1) + \cdots + s_n(\varepsilon, K_m) \). Fix \( \varepsilon > 0 \). For each \( n \in \mathbb{N} \), choose \( K_{i(\varepsilon, n)} \) such that \( s_n(\varepsilon, K_{i(\varepsilon, n)}) = \max_{1 \leq i \leq m} s_n(\varepsilon, K_i) \). Then \( s_n(\varepsilon, K) \leq m \cdot s_n(\varepsilon, K_{i(\varepsilon, n)}) \) and so,

\[
\begin{align*}
  \log s_n(\varepsilon, K) \leq \log m + \log s_n(\varepsilon, K_{i(\varepsilon, n)}).
\end{align*}
\]

Choose \( n_j \to \infty \) such that

\[
\begin{align*}
  \frac{1}{n_j} \log s_{n_j}(\varepsilon, K) \to \limsup_{n \to \infty} \frac{1}{n} \log s_n(\varepsilon, K)
\end{align*}
\]

and so that \( K_{i(\varepsilon, n_j)} \) does not depend on \( j \) (i.e., \( K_{i(\varepsilon, n_j)} = K_{i(\varepsilon, n)} \) \( \forall j \)). Therefore \( s(\varepsilon, K, f) \leq s(\varepsilon, K_{i(\varepsilon, n_j)}, f) \). Choose \( \varepsilon_q \to 0 \) so that \( K_{i(\varepsilon_q)} \) is constant (\( = K_{i_0} \), say). Hence \( h_d(f, K) \leq h_d(f, K_{i_0}) \leq \max_{1 \leq i \leq m} h_d(f, K_i) \).

**Corollary 3.1.** Let \( (X, d) \) be a metric space and \( f \in \text{UC}(X, d) \) and also let \( \delta > 0 \). In order to compute \( h_d(f) \), it is suffices to take the supremum of \( h_d(f, K) \) over those compact subsets of diameter less than \( \delta \).

**Proof.** Since \( K \) is compact, it can be covered by a finite number of balls \( B_1, \ldots, B_m \) of diameter \( \frac{\delta}{2} \) and hence \( h_d(f, K) \leq \max_{1 \leq i \leq m} h_d(f, K \cap \overline{B_i}) \), so that \( h_d(f) = \max_{1 \leq i \leq m} h_d(f, K \cap \overline{B_i}) \).

**Corollary 3.2.** If \( X \) is a compact metrizable space and \( d \) is any metric on \( X \), then

\[
\begin{align*}
  h(f) = h_d(f) = h_d(f, X) = h(f, X).
\end{align*}
\]

**Proof.** If \( K \) is a compact subset of \( X \), then \( h_d(f, K) \leq h_d(f, X) \). It follows from Theorem 4(i) that \( h_d(f) \) does not depend on \( d \).

When \( X \) is compact, Corollary 3.2 can be used to simplify the definition of \( h(f) \). Take any metric \( d \) giving the topology of \( X \), then

\[
\begin{align*}
  h(f) &= \lim_{\varepsilon \to 0} \limsup_{n \to \infty} \frac{1}{n} \log s_n(\varepsilon, X) \\
  &= \lim_{\varepsilon \to 0} \limsup_{n \to \infty} \frac{1}{n} \log s_n(\varepsilon, X).
\end{align*}
\]

These expressions have the following interpretation. Suppose we want to count the number of orbits of length \( n \) (an orbit of length \( n \) is a set \( \{x, f(x), \ldots, f^{n-1}(x)\} \) but we can only measure to an error \( \varepsilon \). Then both \( n_\varepsilon(x, X) \) and \( s_n(\varepsilon, X) \) can be interpreted as the number of orbits of length \( n \) up to error \( \varepsilon \). So as \( \varepsilon \to 0 \), \( h(f) \) is a measurement of the growth rate in \( n \) of the number of orbits of length \( n \) up to error \( \varepsilon \).

Other papers dealing with extensions of topological entropy to non-compact spaces are Hofer [8], Bowen [3], Canovas [4], Canovas& Rodriguez [7], and Canovas& Linero [5, 6].

Next we make a slight modification on the symbol of refinement. The properties of this modification also investigated below.

**Definition 3.3.** A cover \( \mathcal{U} \) is said to be a refinement of a cover \( \mathcal{V} \), denoted as \( \mathcal{U} \prec \mathcal{V} \), if every member of \( \mathcal{U} \) is a subset of some member of \( \mathcal{V} \). In other words, \( \mathcal{U} \prec \mathcal{V} \) if \( A \in \mathcal{U} \), there exists a \( B \in \mathcal{V} \) such that \( A \subseteq B \).

The following proposition is analogue results of Lemma 2.3.

**Proposition 3.1.** Let \( \mathcal{U}, \mathcal{V}, \mathcal{U}' \) and \( \mathcal{V}' \) be open covers of \( X \). Then the following statements hold:

(i) \( \mathcal{U} \prec \mathcal{U}' \prec \mathcal{V} \prec \mathcal{V}' \Rightarrow \mathcal{U} \lor \mathcal{V} \prec \mathcal{U}' \lor \mathcal{V}' \).
A Note on Topological Entropy of Continuous Self-Maps

(i) \( \mathcal{U} \times \mathcal{V} \Rightarrow N(\mathcal{U}) \geq N(\mathcal{V}) \) and \( H(\mathcal{U}) \geq H(\mathcal{V}) \).

(ii) \( \mathcal{U} \subset \mathcal{V} \Rightarrow N(\mathcal{U} \cup \mathcal{V}) = N(\mathcal{U}) \) and \( H(\mathcal{U} \cup \mathcal{V}) = H(\mathcal{U}) \).

Proof. (i) Consider \( A \cap B \in \mathcal{U} \cup \mathcal{V} \) where \( A \in \mathcal{U} \) and \( B \in \mathcal{V} \). By hypothesis there exists \( A' \in \mathcal{U}' \) and \( B' \in \mathcal{V}' \), such that \( A' \subseteq A' \) and \( B' \subseteq B' \). Thus \( A \cap B \subseteq A' \cap B' \) where \( A' \cap B' \in \mathcal{U}' \cup \mathcal{V}' \).

(ii) Let \( \{A_1, ..., A_N(\mathcal{U})\} \) be a subcover of \( \mathcal{U} \) of minimal cardinality. Since \( \mathcal{U} \subset \mathcal{V} \), there exists a subcover \( \{B_1, ..., B_N(\mathcal{U})\} \) of \( \mathcal{V} \) such that \( A_i \subseteq B_i \) for all \( i = 1, ..., N(\mathcal{U}) \). Therefore \( N(\mathcal{U}) \geq N(\mathcal{V}) \).

(iii) Obviously by (i), \( \mathcal{U} \cup \mathcal{V} \subset \mathcal{U} \cup \{X \} = \mathcal{U} \) so that \( N(\mathcal{U} \cup \mathcal{V}) \geq N(\mathcal{U}) \) by (ii). On the other hand, \( \mathcal{U} \subset \mathcal{V} \) and \( \mathcal{U} \subset \mathcal{U} \) implies \( \mathcal{U} \subset \mathcal{U} \cup \mathcal{U} \subset \mathcal{U} \cup \mathcal{V} \). Thus \( N(\mathcal{U}) \geq N(\mathcal{U} \cup \mathcal{V}) \).

(iv) Let \( A \in f^{-1}(\mathcal{U}) \), then \( f(A) \in \mathcal{U} \). Since \( \mathcal{U} \subset \mathcal{V} \), there exists \( B \in \mathcal{V} \) such that \( f(A) \subseteq B \). This implies that \( A \subseteq f^{-1}(f(A)) \subseteq f^{-1}(B) \subseteq f^{-1}(\mathcal{V}) \). Thus \( f^{-1}(\mathcal{U}) \subset f^{-1}(\mathcal{V}) \).

(v) By part (i) and (iv), it follows that \( \mathcal{U} \cup f^{-1}\mathcal{U} \cup \cdots \cup f^{-n+1}\mathcal{U} \subset \mathcal{V} \cup f^{-1}\mathcal{V} \cup \cdots \cup f^{-n+1}\mathcal{V} \) for all \( n \in \mathbb{N} \). Therefore by (ii)

\[
H(\mathcal{U} \cup f^{-1}\mathcal{U} \cup \cdots \cup f^{-n+1}\mathcal{U}) \geq H(\mathcal{V} \cup f^{-1}\mathcal{V} \cup \cdots \cup f^{-n+1}\mathcal{V}).
\]

This yields the claim. ■

Theorem 3.3. For the topological entropy of iterates the following formula holds:

\[
h(f^k) = kh(f) \quad \text{for all} \quad k \in \mathbb{N}.
\]

Proof. The proof of first part is similar to the proof of Theorem 2.3. The proof for the second part is as follows. For any open cover \( \mathcal{U} \), \( \bigvee_{i=0}^{n-1} f^{-i} \mathcal{U} \), we have

\[
h(f, \mathcal{U}) = \lim_{n \to \infty} \frac{1}{nk} H\left(\bigvee_{i=0}^{n-1} f^{-i}(\mathcal{U})\right)
\]

\[
\geq \lim_{n \to \infty} \frac{1}{nk} H\left(\bigvee_{i=0}^{n-1} f^{-i}\mathcal{U}\right)
\]

\[
= \frac{1}{k} \lim_{n \to \infty} \frac{1}{n} H\left(\bigvee_{i=0}^{n-1} f^{-i}\mathcal{U}\right)
\]

by Proposition 3.1(ii). Thus \( kh(f) \geq h(f^k) \). ■
